

The careful assembly of valve and actuator is critical to ensure that an automated valve performs correctly and reliably. Whilst this service is often provided by a valve manufacturer, there is a growing need for actuators to be installed on valves after they have left the valve manufacturer's factory.

The Rotork Factory-Fit service provided at our network of service centres around the world meets this need. Whether it is helping a local valve distributor provide an actuated valve solution to their customer or managing the supply of a large quantity of automated valves on a major project for a contractor or end-user we are equipped to meet your requirements.

With our complete range of electric and fluid-power valve actuators we can automate all valve types regardless of the available power supply. Working with the engineer responsible for the specification we will select the correct actuator type and size based on the basic valve data and the plant operational criteria. The next step is for the design team at our local service centre to engineer the components needed to modify the valve so that the actuator can be mounted.

The design of this adaption kit may be based on a certified drawing of the valve, or more commonly on dimensions taken directly from the actual valve after it is delivered to us. If required we can produce drawings showing the complete valve and actuator assembly to enable our customer to verify the correct orientation and ensure that there is sufficient space available for installation. Once the adaption kit has been manufactured, it is installed onto the valve by our factory-trained technicians who then install the actuator and perform a full range of functional tests on the finished assembly.

Whilst we can provide complete automated valve packages the most common arrangement is for the valves to be delivered free-issue to our local service centre.

Our actuators, adaption kits and installation service are all backed by the worldwide Rotork warranty.

Once the automated valves have been installed on site our field service technicians are available to assist with final commissioning. As the actuators mature we are also able to provide an on-going preventative maintenance program plus on-site and shop based repair services.

Calgary Office
Bay #6, 820 – 28th Street NE
Calgary, Alberta, T2A 6K1
